OLLORUN HEALTH

OUR EXPERTISE

OLLORUN.COM

OLLORUN researches and develops biotechnology-approved formulations for various skin pathologies. The product ranges developed include anti-acne, anti-ageing, anti-fatigue, anti-wrinkle, anti-fall, anti-scar, anti-stain, anti-bacterial treatments.

OLLORUN formulations are based on a superior diffusion system that encapsulates active ingredients that penetrate deeply and rapidly into the epidermis. The skin is naturally more resistant and healthier.

EGF

Thus, **OLLORUN** is the pioneer of the medical patent **technology of biotechnological DNA**.

Dedicated to **skin treatment**, our ranges recreate the ideal cellular environment for the skin to regain its own regenerative capacities. It is composed exclusively of elements naturally present in the skin and essential to the life, functionality and regeneration of cells. The skin regains its original biological function and is recharged with all the resources it needs for true **skin regeneration**.

Thanks to the action of **EGF**, **bFGF growth factor**, as well as important ingredients such as **hyaluronic acid** (natural HA), our formulas work deep within the skin to enhance cell proliferation, prevent collagen degradation, resist cell aging, and quickly eliminate wrinkles and scars. They also improve the regenerative function of young cells and fully regenerate the skin so that it looks **younger** and **brighter**.

- 30 ml

Standard ISO 22716

ISO 22716 version 2007 is the standard for guidelines for the production, control, storage and dispatch of cosmetic products.

These guidelines cover aspects related to product quality but, in their entirety, do not cover aspects related to the safety of the personnel working in the plant, nor aspects related to environmental protection. Safety and environmental aspects are inherent responsibilities of the company and may be governed by local regulations and legislation.

These guidelines do not apply to research and development activities or to the distribution of finished products.

The company producing the **OLLORUN** brand is certified ISO 22716 version 2007.

Without Paraben

Many cosmetic and pharmaceutical products have used parabens, a group of chemical compounds that act as preservatives and whose effects can be harmful to health. Parabens are allergenic, can irritate the eyes and skin, and appear to have estrogenic activity.

OLLORUN certifies that it does not use parabens in its cosmetic products.

Good Manufacturing Practices

Good Manufacturing Practices or GMP is a concept of quality assurance. The holder of a manufacturing authorization must manufacture a product that is fit for purpose, complies with its specifications as defined in the marketing authorization and does not expose a patient to a risk that could compromise the safety, quality or efficacy of the product.

With this in mind, GMPs seek to limit two categories of risk:

- The risks of cross-contamination of products (by another product, or an internal and external contaminant);
- The risks of confusion, particularly with regard to labelling and identification of components. The company producing the **OLLORUN** brand is GMP certified.

100% Natural ingredients

The certification of production and processing processes that respect the environment and human health, the responsible use of natural resources and respect for biodiversity.

All the ingredients used in **OLLORUN** brand products are of natural origin.

Not tested on animals

Animal testing of cosmetics is a type of animal testing used to test the safety and hypoallergenic properties of products intended for use by humans. Because of the harm caused to animal subjects, these tests are challenged by animal rights activists and others. Animal testing for cosmetic purposes is banned in the European Union, India, Israel and Norway.

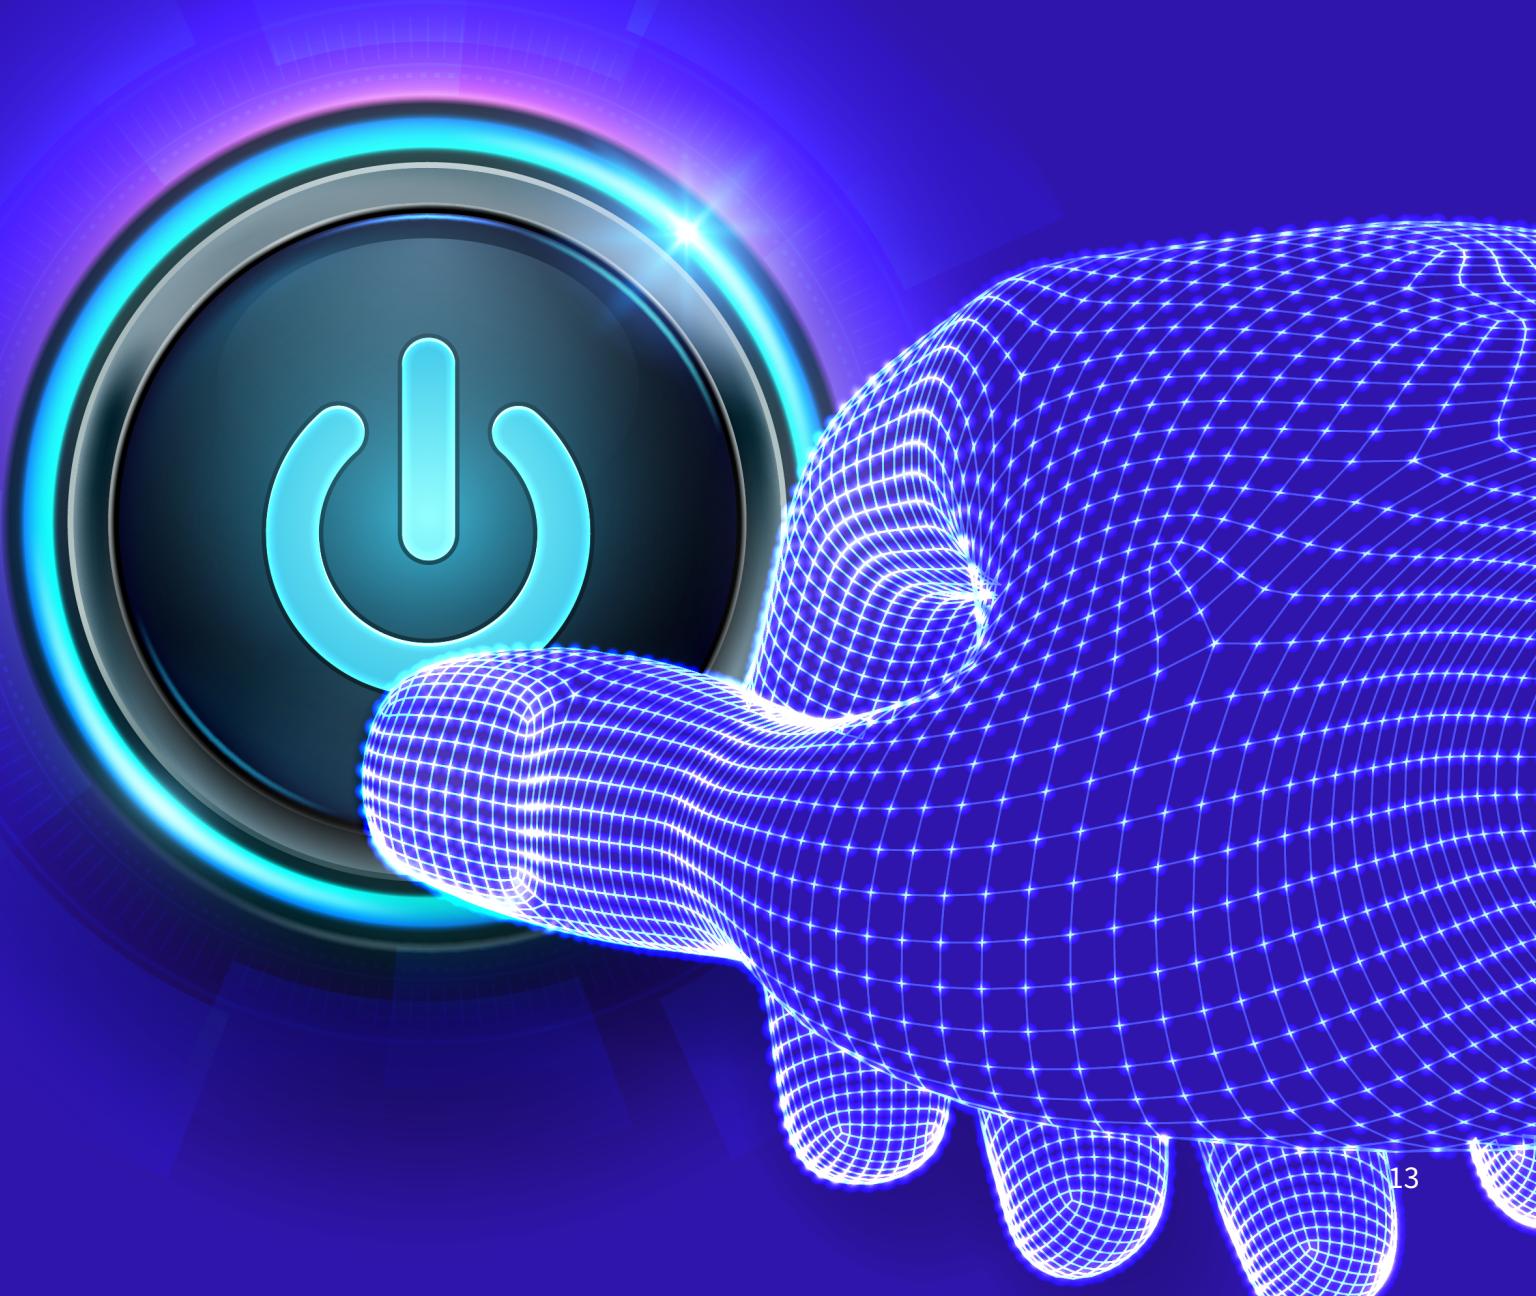

The Australian label CCF (Choose Cruelty-Free) guarantees that the company producing the **OLLORUN** brand does not carry out any tests on animals and does not sell its products in a country that allows animal testing.
